Claims

[c1]	A method for conducting secure communication, comprising:
	communicating a purchase request from first location to a second location;
	communicating a first identification request from said second location to
	said first location;
	communicating a second identification request from said second location to
	a third location;
	communicating a third identification request from said first location to said
	third location; and
	communicating a confirmation of identification from said third location to
	said first location and said second location.
[c2]	The method of claim 1, wherein said third identification request is encrypted.
[CZ]	The method of claim 1, wherein said time identification requires and property
[c3]	The method of claim 1, wherein said third identification request is produced
	by using a system of pad encryptions.
[c4]	The method of claim 3, wherein said system of pad encryptions is employed
	only once.
r =1	The work of a faire 1 who win said confirmation of identification is
[c5]	The method of claim 1, wherein said confirmation of identification is
	encrypted.
[c6]	The method of claim 1, wherein said confirmation of identification is
	encrypted using a public/private key encryption system.
[c7]	The method of claim 1, wherein said confirmation of identification is
[07]	produced by using a system of pad encryptions.
	produced by using a system of pad eneryptions.
[c8]	The method of claim 7, wherein said system of pad encryptions is employed
	only once.
[c9]	The method of claim 1, wherein said first location has a computer.
[c10]	The method of claim 9, wherein said purchase request originates from said
	computer.

The method of claim 1, wherein said first location has an authentication [c11] device. The method of claim 11, wherein said third identification request originates [c12] from said authentication device. The method of claim 11, wherein said authentication device has [c13] microprocessors, an information storage capacity, a power source, and connecting devices. The method of claim 11, wherein said authentication device has an input [c14] device. The method of claim 11, wherein said authentication device has an output [c15] device. A security system for providing exchange of secure information through a [c16] network, comprising: at least one user interface coupled to the network for producing the secure information; at least one receiving station coupled to the network for receiving a message from said at least one user interface; and a verification station, coupled to the network, for receiving the secure information from said at least one user interface, and for transmitting a verification signal to said at least one receiving station to verify identity of said at least one user interface. The system of claim 16, wherein said at least one user interface has a [c17] computing device interfaced to the network. The system of claim 17, wherein said at least one user interface has an [c18]

encoding device external with respect to said computing device.
